## (54) FILM OF THERMOPLASTIC LIQUID CRYSTAL POLYMER AND IMPROVEMENT OF THE SAME

## (57)Abstract:

PROBLEM TO BE SOLVED: To certainly and inexpensively prevent delamination of a film of thermoplastic liquid crystal polymer by carrying out a thermal shrinkage under unstressed condition to modify the film comprising a thermoplastic polymer formable of a melt phase having optical anisotropy.

SOLUTION: The object film is modified by applying a thermal shrink ·2% to the film of the thermoplastic polymer formable of a melt phase having optical anisotropy (liquid crystal thermoplastic polymer) under unstressed condition. Stretched laminate obtained by stretching a laminate comprising the film of a thermoplastic liquid crystal polymer and support film is preferably applied thermal shrink ·10% under unstressed condition. Thermal shrinking is preferably carried out in a hot-air drying oven at the temperature 15° C lower than the melting point to the melting point of the polymer.

Aromatic or aliphatic dihydroxy compounds [e.g.; X is H, a halogen or the like] or the like are enumerated as raw material for the thermoplastic liquid crystal film.
